Industry Overview

Biofuel is a green, clean fuel produced via the transesterification of edible and non-edible oils. It is renewable, cost-effective, carbon-neutral, and non-toxic compared to conventional sources of fuels. the various types of biofuels are like Wood, Biogas, Biodiesel, Ethanol, Methanol, Butanol. It is apparent that biofuels are an essential component of our future energy supply and in the reduction of greenhouse gas emissions. More innovation is key to unlocking the true potential of biofuels, particularly for transport, to scale-up and improve cost-effectiveness.

The production volume of biodiesel fuel in India was forecast to stand at 185 million litres in 2022. Biodiesel can be produced from vegetable oil, animal fats, and waste oils. Maize, sugarcane, and sugar beets are the main traditional substrates used for biofuel production. In Indian prospective, it is imperative to search for non-food feedstocks for long-term sustainability and economic viability of Indian bioethanol market. The government has decided to **step up domestic manufacture of biofuels by 10 per cent every year and has advanced the target of blending 20 per cent ethanol in petrol to 2025, from 2030.**
